Overview

The GCB Payment Gateway enables seamless and secure payment processing for digital transactions for our customers. The gateway consists of REST APIs and an online Checkout page that customers can leverage in the Web and Mobile Apps in taking payments. This REST API provides two primary endpoints:

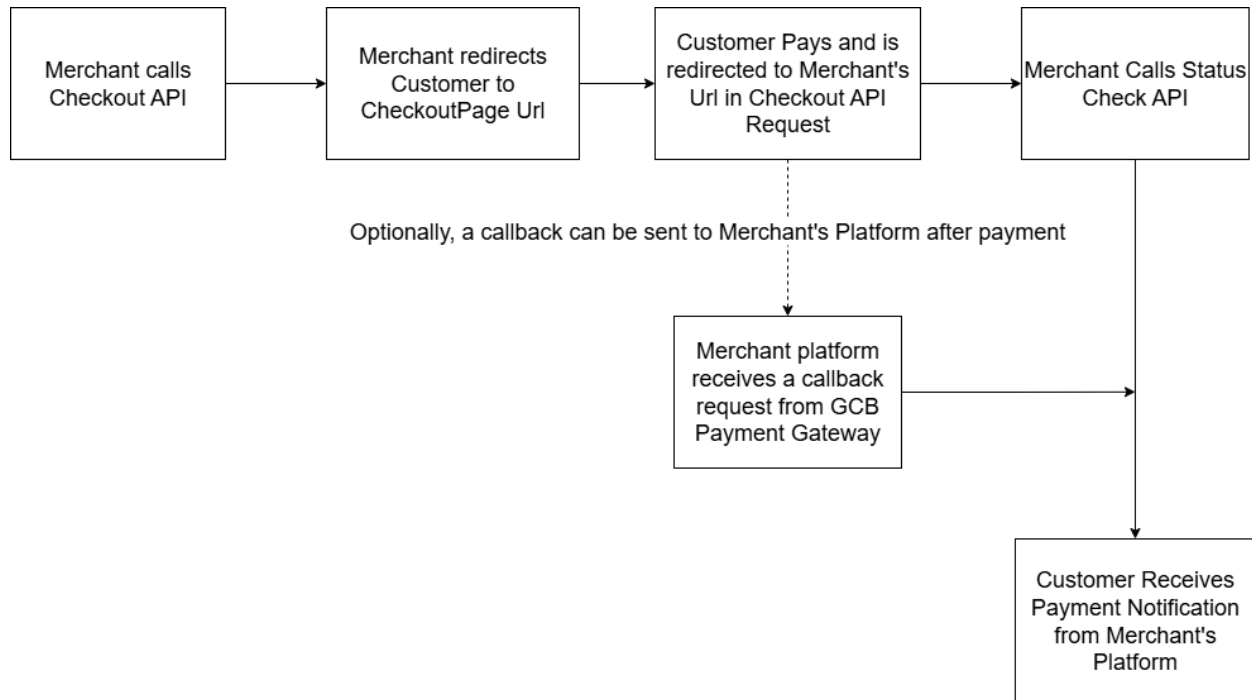

1. Checkout Endpoint - Initiates a payment transaction.
2. Status Check Endpoint - Verifies the status of a payment transaction.

Authentication and Security

GCB Payment Gateway provides a simple yet secure way of taking payments from customers. The gateway is secured by the following measures.

1. GCB provides the caller with an X-API-Key. This key should be passed in the header for all requests to the Payment Gateway REST APIs
2. GCB will need to whitelist the IP of the caller before the caller application can access the REST API. (This requirement is relaxed in the UAT/TEST environment)
3. GCB does not keep any sensitive card information about the customer
4. Checkout Page generated expires after 5 minutes. (This requirement is relaxed in the UAT/TEST environment)

Payment Gateway Transaction Flow

1. Merchant Calls Checkout API: Merchant calls Checkout API. The response to the API includes a URL to which customers must be redirected to.
2. Merchant redirects Customer to the URL from the response to the Checkout API. Merchant keeps track of the **CheckOutId** and **MerchantRef**.
3. The Customer proceeds to make payment on the CheckOut Page. Once payment is completed, customer is redirected back to merchant's platform. The URL to which the customer is redirected is the one included in the original Checkout API call. The merchant's **MerchantRef** is appended to the URL when customer is redirected back to the Merchant's platform.
4. Once Customer is back on Merchant's platform, merchant extracts the **MerchantRef** from the URL and calls the Transaction Status Check API using the corresponding **CheckOutId**, which should be stored in Merchant's System.

Checkout Endpoint

The Checkout Endpoint is called by the initiating platform to initiate a payment request by submitting transaction details.

Method: **POST**

URL: **/checkout**

Sample Request

```
{
  "merchantRef": " AA00000000001",
  "amount": 10,
  "currency": "GHS",
  "description": "Fee Payment",
  "paymentOption": null,
  "callbackUrl": " https://example-callback.com"
}
```

REQUEST DEFINITIONS

META	DEFINITION	Required	COMMENTS
merchantRef	A unique reference provided by caller to uniquely identify transaction	YES	Alphanumeric Max Length (20)
amount	Amount to debit from customer	YES	Two decimal places
currency	Currency of checkout transaction	YES	Max Length (3)
description	Description of transaction	YES	Max Length (500)
paymentOption	Specify which payment option should be available to payer	NO	See Appendix for options
callBackUrl	Url to redirect customer after payment is completed	YES	Max Length (500)

Sample Response

```
{
  "checkOutUrl": "https://epayuat.gcb1td.com:98/paymentgateway/checkout?id=afc44af7-a4b0-4c52-ba9f-a3af1792d4c2",
  "checkOutId": "afc44af7-a4b0-4c52-ba9f-a3af1792d4c2"
}
```

RESPONSE DEFINITIONS (NE GIP)

META	DEFINITION
checkOurUrl	Url of checkout page to redirect customer where they can complete payment
checkOutId	Unique Id to identity transaction provided by GCB

Status Check Endpoint

The status check endpoint allows the consumer to confirm the status of the checkout transaction. The endpoint also provides additional information on when the payment was completed and what payment method the payer used to complete the payment process.

Method: **GET**

URL: **transactions/{checkoutId}/status**

Sample Response

```
{
  "merchantRef": "AA000000000001",
  "status": "00",
  "bankRef": "999EPAY0000001",
  "timeCompleted": "2025-03-03 19:00:00",
  "paymentOption": "card"
}
```

RESPONSE DEFINITIONS

KEY	DEFINITION
merchantRef	A unique reference provided by caller to uniquely identify transaction
status	Status code of transaction. See below for codes and descriptions.
bankref	Reference for transaction statement entry that is credited to caller's bank account
timeCompleted	Time payer completed payment
paymentOption	The payment option that was used by payer for completing payment

Callback Service

The GCB Payment Gateway features an optional callback service that is available for merchants to ensure timely system updates when transactions are processed. The Gateway pushes a REST call (details below) to a Callback Service URL provided by the Merchant during setup. GCB will provide IPs for your whitelisting to ensure callback requests only come from GCB

Request

```
{
  "merchantRef": "A0000000000001",
  "statusCode": "00",
  "timeCompleted": "2025-03-01 13:05:00",
  "bankRef": "139EPAY0000025",
  "paymentOption": "card"
}
```

Expected Result: HTTP Status Code: 200

N.B. Payment Gateway will continue to send the Callback in 5-minute intervals for about 30 minutes if any other HTTP Status Code is received.

Appendix

Payment Options

OPTION	DEFINITION
momo	Mobile money services e.g. MTN Mobile Money, Vodafone Cash
card	Card Payments, e.g. VISA, MASTERCARD
gcb	Payment with GCB Account
mtn	MTN Mobile Money service
vodafone	Telecel Cash Service
airteligo	AT Cash Service

Transaction Status Codes

CODE	DEFINITION
00	Payment Successful
01	Payment Pending
02	Payment Failed
03	Checkout Url Expired
04	Checkout Id not found or any other caller error
05	Internal Error
